

# PAHs and Phthalate Monitoring at Urban Waters Summer-Winter 2011

Justin P. Miller-Schulze, Ph.D.

Research Associate

Baker Laboratory/Center for Urban Waters

December 20 2011

# Welcome

- Introduction
- Sampling
- Analysis
- Data
- Future Work

# Objective (s)

- Wanted to get some preliminary data on PAHs & phthalates/**get analytical laboratory 'up and running'**
- Initial project funding to purchase sampling equipment to study phthalate deposition
  - Atmospheric deposition and surface runoff are significant source of these species in Puget Sound

# Quick Background-PAHs

- Polycyclic Aromatic Hydrocarbons (PAHs) known to be both carcinogenic and mutagenic
- PAHs are also employed as markers of combustion processes
- Part of the Puget Sound Partnerships' Action Agenda is to 'Reduce the Source of Toxic Chemical Entering Puget Sound'
  - PAH levels in fish explicitly stated as part of this goal

# Quick Background-Phthalates

- Phthalates primarily used as plasticizers in products such as PVC (poly vinyl chloride) piping<sup>1</sup>
  - BBP (benzyl butyl) predominant stain-resistant plasticizer in PVC
  - DBP (di *n*-butyl) plasticizer in nail polish, explosives, rocket propellant
  - Etc....
- Most significant (or studied) route of exposure seems to be ingestion (food, cosmetics, toys)
  - Not much data on outdoor concentrations, as indoor exposures assume to be much more prevalent
- Primary health concern is with reproductive health and/or fetal development

# Sampling

- TISCH Corp Hi-Vol Air Sampler located on roof of Center for Urban Waters
  - Approximate height of sampler = **16.8 m** above sea level
- Two Phases of Samples Collected:
  - Total suspended particulate (TSP) w/ quartz filters for particulate-phase species
  - Gas-phase w/ polyurethane foam (PUF) media for gas-phase species

# Sampling

- Sampling done on EPA's 1-in-6 day sampling schedule
- Flow rate =  $\sim 180$  L/min
- Samples collected are 24-hour integrated samples
  - Total volume sampled =  $\sim 275$  m<sup>3</sup>
- Meteorological data collected on w/ 0.5 hour resolution at co-located met station

# Sampling/Analysis

Step 1: Air Sampling  
EPA 1-in-6 Day  
Schedule

Step 2: Soxhlet  
Extraction

Step 3:  
Evaporation/Concentration  
(Rotovap)

Spike with Recovery  
(Surrogate) standards here

Step 5: Analysis via  
GCMS

Step 4:  
Evaporation/Concentration  
(Turbovap)

Spike with quantification  
(Internal) standards here

# Quantification of Analytes

- Sequence specific calibration curves used to calculate mass of analytes/sample
  - 1/X weighting employed due to linear range issues
- Limit-of-Detection (LOD) calculated as:

$$\text{LOD} = \text{CONC}_{\text{AVG (methodblank)}} + 3x (\text{Std Dev}_{\text{methodblank}})$$

- Different blanks used for filter and PUF samples

	Gas-Phase (PUF)			Particulate-Phase (Filter)		
	Surrogate % Recovery (RSD)	<u>LOD</u> Nominal Air Concentration (ng/m <sup>3</sup> )	% Above Limit of Detection	Surrogate % Recovery (RSD)	<u>LOD</u> Nominal Air Concentration (ng/m <sup>3</sup> )	% Above Limit of Detection

Butyl Benzyl Phthalate

Di-ethylhexyl Phthalate

# Summary/Conclusions

- Out of 14 PAHs, 8 detected reliably above LOD in either gas or particulate phase
  - Chrysene, benzo(a) anthracene >50%
  - Heavy PAHs problematic due to high blanks/low sensitivity
- Concentrations of what was detected reliably in-line with data from Baltimore, Buffalo
- Out of 6 phthalate esters, 4 detected reliably detected above (high) LODs
  - All but di-methyl phthalate in particulate phase

# Future Work

- Questions:
  - What is the variability and source strength of specific sources of PM?
  - Now that we have begun to estimate ambient concentrations of PAHs and phthalates, what is the extent of deposition due to precipitation?
- First step: quantification of additional PAHs that in GCMS method that are tracers for specific combustion types (retene/soft wood burning, coronene/gasoline exhaust)
  - Optimization of method and driving down of LODs in parallel with above

# Future Work

- Currently archiving filters collected starting November to enable sectioning (punching) for additional analyses
  - Planning extract punches for levoglucosan and nitro-PAHs
- Levoglucosan will be analyzed via derivitization and GC-MS
  - Levoglucosan is a well-defined marker for woodsmoke emissions
- Nitro-PAHs by GC-MS or LC-MS/MS
  - 1-nitropyrene (and 3-nitrofluoranthene) are markers for diesel exhaust
  - Other nitro-PAHs (2-nitropyrene, 4-nitropyrene, 2-nitrofluoranthene) are markers for secondary formation processes
    - Both techniques and methods exist in-house at CUW

# Future Work

- Atmospheric Deposition:
  - Beginning of rainwater collection and analyses for similar analytes as described in this presentation
